

## Project 2: Yelp DataSet

Team: Prateetya Bajracharya, Kelly McClendon, Roma Patel, Wenxuan Gu

Whenever we go to a new place whether it's a restaurant, salon, grocery store, we checkout the yelp data for advice and recommendations. Simultaneously, many businesses heavily rely on customer's reviews and ratings. These are very important mostly for the small or medium size businesses.

We got our Data from the Yelp Data Set, which was easily accessible to the public. All the business information is there such as: locations, category, contact information, business hours, etc.

With all this information, we will try to analyze the DataSet and try to provide business insights on how reviews and ratings really affect certain businesses.

We got our data in JSON Format, which we will be using it on MongoDB server.
